

The Future for Dairy Cow Nutrition & Health

Moving toward precision management

Monday, 5th June 2017

Nottingham University

New technologies to monitor performance and welfare provide a wealth of information on how cows respond to their nutrition and environment. How can we use this information to improve efficiency and profitability of systems, health and welfare of cows, quality of milk products, and image of dairying for the consumer?

This meeting will present ideas from leading experts and provide an opportunity for you, as members of industry, to provide feedback on what you consider are the most important things to work on. Your ideas will help drive the innovation agenda for CIEL with its academic & industry members.

New dairy facilities at University of Nottingham, co-funded by CIEL, will be visited during the day.

The event will run from 1000-1600h, on Monday 5th June 2017. Lunch and refreshments provided.

Speakers

The future for dairy cow nutrition & health – what does it hold? by Paul Tompkins, Yorkshire dairy farmer

Future nutrition systems – Professor Phil Garnsworthy (Nutrition, efficiency & environmental impact) & Dr Jean Margerison (Calf & heifer rearing).

Future health management – Professors Martin Green & Jon Huxley (Dairy cow health; where are we now, where should we go?) & Professor James Leigh (Modern developments in dairy cow vaccines)

Directions to the event will be sent to those who pre-register. Please register by sending an email to
